SECONDARY REPARABLE (SECREP) MANAGEMENT

Background

In February and April of 2007, Marine Corps Logistics Command (MCLC) hosted two separate workshops to refine their roles and missions in support of SECREP Management. The intent of expanding LOGCOM's role in SECREP Management support is to increase flexibility and improve supply chain performance for the Operating Forces. These outcomes will be achieved through standardized processes, improved configuration management and improved containerization management across the enterprise.

LOGCOM's main roles in SECREP Management are:
- Process standardization and mapping across the enterprise.
- Lead agent for the recomputation of account balances.
- Configuration coordination and tracking across the enterprise.
- Coordination and tracking of source of repair and rebuild.
- Container and packaging standardization and management.
- Cross-leveling coordination of excesses for shortfalls.
- Enterprise-wide asset tracking and visibility.
- Training and management mentoring.

Benefits of the LOGCOM Concept of Support for SECREP Management include:
- Establishes a single point of contact to integrate, coordinate, and supervise SECREP Management process improvement.
- Provides the enterprise visibility of shortfalls and excesses for cross-leveling opportunities.
- Establishes an enterprise SECREP configuration standard through coordination and oversight of repair and rebuild activity output.
- Shared management responsibilities at main Reparable Issue Points which supports increased flexibility for Operating Forces resources, increases integration and supports improved training.

Game Objectives

Examine the feasibility and practicality of the recommended LOGCOM Concept of Support for SECREP Management. Particular attention will be paid to the following:
- Examine LOGCOM's ability to coordinate and track SECREP asset postures to support cross-leveling opportunities across the Marine Corps.
- Examine LOGCOM's ability to coordinate and track configuration of SECREP assets repaired within the Marine Air-Ground Task Force and rebuilt at Sustainment level maintenance activities.
- Examine LOGCOM's ability to coordinate and track evacuation of SECREPs from forward deployed locations.
